

Project Implementation and Testing

Date	8th July 2024
Team ID	SWTID1720074725
Project Name	CodeXchange: An AI-Powered Code Translator Tool

Testing and Evaluation

Testing Strategy

The tool will be rigorously tested using a diverse set of code snippets in Python, Java, and C++ to ensure both accuracy and functionality. Testing will encompass both the user interface (Streamlit) and the command-line interface (CLI), focusing on performance, reliability, and user experience.

Test Cases and Results

Test cases will cover a wide range of scenarios, including:

- Simple Functions:** Basic code snippets such as "Hello, World!" programs and simple arithmetic operations.
- Complex Algorithms:** More intricate code involving data structures, algorithms, and libraries.
- Edge Cases:** Scenarios with syntax errors, incomplete code snippets, and unconventional coding styles.

Each test case will be evaluated for:

- **Translation Accuracy:** Ensuring the translated code maintains the same logic and functionality as the original.
- **Error Handling:** Verifying that the tool appropriately handles syntax errors and incomplete code.
- **Performance:** Assessing the speed and responsiveness of the translation process.

Results will be analyzed to ensure high accuracy and reliability. Any identified issues will be addressed through iterative adjustments and refinements to the tool.

Sample Test Cases:-

Test Case 1:-

```
1  #include <iostream>
2
3  int main() {
4      std::cout << "Hello, World!";
5      int a = 5;
6      int b = 7;
7      int c = a + b;
8      std::cout << c;
9      return 0;
10 }
```

Platform Transition

Easily migrate your codebase from one programming language to another, ensuring seamless platform transition and reducing development time.

Multilingual Collaboration

Facilitate collaboration among developers who prefer different programming languages by translating code, enabling a more inclusive and productive team environment.

Code Reusability

Maximize code reuse by translating existing code into different languages for various projects, ensuring consistency and saving time on development.

Enter the code snippet you want to translate:

```
#include <iostream>
```

```
int main() {
```

Select the target programming language:

C++

Translate

Enter the code snippet you want to translate:

```
#include <iostream>
```

```
int main() {
```

Select the target programming language:

Python

Translate

Code translation complete!

Sure, here is the translation of the given code to Python:

```
print("Hello, World!")
a = 5
b = 7
c = a + b
print(c)
```

Test Case 2:-

```
1 // Merge Sort Algorithm
2 #include <iostream>
3 #include <vector>
4
5 using namespace std;
6
7 void merge(vector<int>& arr, int left, int mid, int right) {
8     int n1 = mid - left + 1;
9     int n2 = right - mid;
10
11     vector<int> leftArray(n1);
12     vector<int> rightArray(n2);
13
14     for (int i = 0; i < n1; ++i)
15         leftArray[i] = arr[left + i];
16     for (int j = 0; j < n2; ++j)
17         rightArray[j] = arr[mid + 1 + j];
18
19     int i = 0, j = 0, k = left;
20     while (i < n1 && j < n2) {
21         if (leftArray[i] <= rightArray[j]) {
```

```
22     arr[k] = leftArray[i];
23     i++;
24 } else {
25     arr[k] = rightArray[j];
26     j++;
27 }
28     k++;
29 }
30
31 while (i < n1) {
32     arr[k] = leftArray[i];
33     i++;
34     k++;
35 }
36
37 while (j < n2) {
38     arr[k] = rightArray[j];
39     j++;
40     k++;
41 }
42 }
43
44 void mergeSort(vector<int>& arr, int left, int right) {
45     if (left < right) {
46         int mid = left + (right - left) / 2;
47
48         mergeSort(arr, left, mid);
49         mergeSort(arr, mid + 1, right);
50
51         merge(arr, left, mid, right);
52     }
53 }
54
55 int main() {
56     vector<int> arr = {12, 11, 13, 5, 6, 7};
57     mergeSort(arr, 0, arr.size() - 1);
58     for (int i = 0; i < arr.size(); i++)
59         cout << arr[i] << " ";
60     cout << endl;
61     return 0;
62 }
```

Platform Transition

Easily migrate your codebase from one programming language to another, ensuring seamless platform transition and reducing development time.

Multilingual Collaboration

Facilitate collaboration among developers who prefer different programming languages by translating code, enabling a more inclusive and productive team environment

Code Reusability

Maximize code reuse by translating existing code into different languages for various projects, ensuring consistency and saving time on development.

Enter the code snippet you want to translate:

```
#include <iostream>
#include <vector>
```

Select the target programming language:

Java

Translate

Code translation complete!

Here is the Java code for the merge sort algorithm:

```
public class MergeSort {

    public static void main(String[] args) {
        int[] arr = {12, 11, 13, 5, 6, 7};
        mergeSort(arr, 0, arr.length - 1);
        for (int i = 0; i < arr.length; i++) {
            System.out.print(arr[i] + " ");
        }
        System.out.println();
    }

    public static void mergeSort(int[] arr, int left, int right) {
        if (left < right) {
            int mid = left + (right - left) / 2;

            mergeSort(arr, left, mid);
            mergeSort(arr, mid + 1, right);

            merge(arr, left, mid, right);
        }
    }

    public static void merge(int[] arr, int left, int mid, int right) {
        int n1 = mid - left + 1;
```

Test Case 3:-

```
1 # Syntax Error
2 def add(a, b):
3     return a + b
4
5 print(add(5, 3)
6
7 # Incomplete Code Snippet
8 def multiply(a, b):
9     return
10
11 # Unconventional Coding Style
12 def Add ( A , B ):
13     return A + B
14 print ( Add ( 5 , 3 ) )
```
